TODAY’S LIBERIA

FROM INVESTMENT APPEALS TO INVESTMENT DEALS

A five-part magazine special | October 12-18, 2026

Agriculture. Energy. Infrastructure. Technology.

How Liberia can turn broad invitations into specific opportunities investors can evaluate, negotiate and finance.

OPINION / INVESTMENT ANALYSIS

Cover: AI-generated conceptual editorial image.

Inside this edition

01 “Liberia Seeks Investment” Is an Invitation. Where Is the Deal?

Broad sector appeals can attract attention while leaving serious investors without a reason to proceed.

02 Agriculture: Pitch the Buyer, the Supply Chain and the Business

A compelling agricultural investment case connects production to customers who can pay.

03 Energy: Investors Need to Know Who Pays for the Power

Generation potential becomes an investment proposition when demand, payment and delivery arrangements are credible.

04 Infrastructure: A National Need Is Only the Beginning of the Investment Case

Roads, warehouses and digital networks require financing structures that match their revenues and public purpose.

05 Technology and the Deal Pipeline: Turn the Presentation Into a Process

A credible pitch identifies a customer problem; a credible investment system follows the opportunity through to delivery.

Editorial approach

This independent five-part series applies the Liberia Investment Gateway concept of project evidence, visible gaps and accountability. Deal processes and county examples are proposals, not verified offers. No separate Gateway pitch deck was located. The argument about broad appeals is editorial analysis, not an investor survey. All cover images are AI-generated conceptual illustrations.

Prepared for Today’s Liberia. Sources checked October 13, 2026. Original analysis; no interviews or actual investment meetings are represented.

FEATURE 01 / BUSINESS

“Liberia Seeks Investment” Is an Invitation. Where Is the Deal?

Broad sector appeals can attract attention while leaving serious investors without a reason to proceed.

AI-generated conceptual editorial image; not a photograph of an actual project or meeting.

Today’s Liberia | Investment Analysis | 13 October 2026

Every major investment appeal should lead to a project brief, a named sponsor and a clear next decision.

“Liberia seeks investment in agriculture, energy, infrastructure and technology.” The sentence sounds ambitious. It identifies important national priorities. But repeated without a concrete commercial proposition, it can become a turnoff for the very investors Liberia hopes to attract.

The weakness is in the pitch. A sector is a category of economic activity; an investment is a specific commitment of capital to a defined enterprise or asset. A fund manager cannot take “agriculture” to an investment committee and ask for approval. The committee needs to know the project, the sponsor, the customer, the capital requirement, the risks and the expected route to repayment or return.

Liberia’s National Investment Commission promotes agribusiness and value-added processing, alongside transport, energy and digital infrastructure.[1] Those priorities provide a useful starting point. The next task is to translate them into opportunities that a potential partner can investigate.

Consider two approaches. The first asks an investor to explore Liberia’s agricultural potential. The second presents a proposed processing facility, identifies its location and operator, explains where its inputs would come from, shows the evidence of buyer demand, and sets out the financing required. Even if the second project is still being prepared, the investor can see which questions need answers.

This is the value of the Liberia Investment Gateway approach: organizing the conversation around projects, evidence and responsibility. A credible presentation should distinguish what has been verified from what remains an assumption. It should name the person responsible for supplying missing documents and explain the next milestone.

The pitch deck then becomes a decision tool. It describes the commercial problem, the proposed solution, the customers, the delivery model, the financial assumptions, the risks and the capital request. Supporting documents allow an interested investor to test the story.

Political access and national enthusiasm can open a meeting. They cannot substitute for a defensible investment case. Neither should a polished presentation conceal unresolved land rights, uncertain costs or missing approvals.

Liberia should continue promoting its opportunities. But every major appeal should lead to a project brief with a named sponsor and a clear action: review the information, visit the site, assess a partnership or begin due diligence.

What the investment committee actually sees

The first audience for a national pitch may be an executive in a conference room. The decisive audience is often a committee elsewhere, reviewing the opportunity against competing uses of its money. That committee will see the documents rather than the atmosphere of the meeting. It must be able to understand the project without relying on a personal introduction to explain its weaknesses.

A presentation should therefore survive being forwarded. The capital request must specify the instrument being sought: equity, a loan, a strategic operating partner or funding for project preparation. These requests involve different rights and responsibilities. A lender looks for repayment capacity; an equity investor examines growth, governance and a plausible way to realize value. An operating partner may be more interested in control, supply arrangements and commercial access.

The work before the roadshow

The World Bank's 2025 Country Economic Memorandum makes diversification, private-sector development and institutional reform central to Liberia's growth discussion.[2] That context strengthens the case for preparing opportunities beyond extractive industries. It also means that a better deck must be accompanied by practical work on the conditions under which businesses

operate.

A small project-preparation team could begin with a limited group of credible sponsors. Its first job would be to assemble the facts: ownership, site control, studies, demand evidence, realistic costs and the sponsor's contribution. Every project would carry an information date and a list of unresolved issues. A well documented modest enterprise could be more useful to investors than a large proposal whose foundations remain uncertain.

A proposed ten-slide discipline

For Liberia Investment Gateway, a practical pitch sequence would cover the opportunity; the customer problem; the solution and location; the market evidence; the operator and ownership; the delivery arrangements; financial assumptions and downside scenarios; risks and safeguards; the financing request and use of funds; and the next decision. This is a proposed editorial framework, not a description of an unseen deck or a guarantee of financing.

The deck should show which evidence supports each major claim. Financial forecasts should include a slower-sales case, higher-cost case and delayed-opening case. The question is whether the enterprise can remain viable when events depart from the sponsor's preferred forecast.

The real cost of a vague invitation

When essential information is absent, investors must either pay to develop it themselves or move to an opportunity that is easier to assess. Some specialist investors will accept early-stage uncertainty, but they need suitable terms and a mandate that allows it. Asking every visitor to discover and design a deal creates unnecessary friction.

Liberia can reduce that friction by matching preparation stages with suitable partners. Concept-stage projects might need feasibility assistance. Prepared enterprises may need growth capital. An established asset may need refinancing or an experienced operator. Each pitch should ask for the next appropriate commitment rather than imply that every proposal is ready for construction financing.

The next decision

The question after an investment conference should be more demanding than “Who attended?” It should be: “Which projects advanced, what evidence did investors request, and who is responsible for the next step?”

Agriculture: Pitch the Buyer, the Supply Chain and the Business

A compelling agricultural investment case connects production to customers who can pay.

AI-generated conceptual editorial image; not a photograph of an actual project or meeting.

Today’s Liberia | Investment Analysis | 13 October 2026

A persuasive agricultural deck connects the harvest to the buyer and the revenue to a sustainable operation.

Liberia's agricultural ambitions deserve a stronger commercial presentation than an appeal to cultivate available land. Land can support production, but it does not explain how an enterprise will make money. Investors need a credible connection between farmers, processing capacity, distribution and paying customers.

That connection should be the center of an agricultural pitch deck.

A proposed rice-processing business, for example, should begin by defining its market. Who would buy its output? What product specifications do those buyers require? How do price, packaging, reliability and delivery compare with competing products? Expressions of interest can help establish a conversation, but they must not be presented as binding purchase commitments.

The next question is supply. A processing plant needs more than equipment. It needs enough suitable raw material, delivered consistently and at a cost the business can sustain. The project should document its proposed sourcing arrangements, seasonal variations, transport requirements, quality controls and payment terms for farmers.

Only then does installed capacity become meaningful. A facility capable of processing a large volume may operate far below capacity if supply or demand is weak. Financial projections should therefore explain expected utilization and test what happens when production ramps up more slowly than planned.

Using the Liberia Investment Gateway approach, an agricultural project could be presented as a county-specific business with a traceable evidence record. Its pitch would identify the operator, proposed site, land arrangements, supplier network, customer pipeline, equipment budget and working-capital requirement. Each claim would have a source, a date and a stated verification status.

Community participation also belongs in the commercial case. Land access, consultation, farmer relationships and environmental safeguards affect whether an enterprise can operate reliably. Treating these matters as paperwork to be completed later creates uncertainty for both communities and investors.

The financing request must separate construction and equipment costs from the money required to buy inputs, pay staff and carry stock before customers pay. A business can have a finished factory and still struggle because its operating cycle was underfunded.

For illustration, a proposed aggregation and processing hub could seek an operating partner first, fund feasibility and sourcing work next, and approach construction financiers after demand and costs are sufficiently established. That sequence would depend on the project; it is not evidence that an actual hub is ready for financing.

The customer must appear before the factory

For an illustrative agricultural hub in Lofa or Bong, the first research assignment would be interviews and documented discussions with potential buyers. Wholesalers, shops, food businesses and institutional purchasers may have different needs. The sponsor would have to determine the product, acceptable quality, order frequency, credit terms and delivered price. Those findings would influence equipment choices and the size of the facility.

National demand is useful background, but a new supplier still has to win customers. A market can be large while a particular enterprise struggles to compete. Reliable quality and delivery may matter as much as the lowest advertised price. A pitch should explain the specific advantage the proposed business would offer.

A real example of a specific financing proposition

IFC's published project disclosure for Liberian American Poultry and Modern Mills of Liberia describes a proposed sustainability-linked loan of

up to US$30 million. It identifies the businesses and proposed expansion activities in poultry and flour milling.[3] The disclosure illustrates the difference between promoting a sector and describing a transaction. It should not be read as proof that funds have been disbursed, or as a Gateway-supported deal.

The lesson is specificity: a defined borrower, an amount, an instrument and a use of proceeds. A smaller Liberian enterprise can apply that discipline at its own scale without imitating the size of the proposal.

The cash cycle behind the harvest

Agricultural working capital deserves a slide of its own. A processor may pay farmers promptly while its buyers pay later. Cash is tied up in raw material, processing, packaging and finished stock. Seasonal purchases can make that requirement larger even when annual revenues look attractive.

The financial model should trace those movements month by month. It should also account for rejected produce, storage losses, transport interruptions and customer arrears. Profit on paper cannot settle wages or purchase the next delivery of crops if the money is still owed by a buyer.

Supplier arrangements need equal care. Farmers should understand quality standards, weighing practices, payment timing and how disputes are handled. Predictable terms can improve the enterprise's sourcing reliability while helping producers plan. The sponsor should avoid promising farmers benefits that its model cannot sustain.

A financing path that follows the evidence

A practical sequence could start with a limited sourcing and sales pilot, followed by a costed design and independently reviewed feasibility work. The results would determine whether to expand, redesign or stop. A pilot is useful precisely because it can expose a weak assumption before construction consumes a larger amount of capital.

The next presentation would report what the pilot demonstrated and what it did not. Procurement quotations, buyer discussions and production records should be dated. Land and community arrangements should be reviewed separately from the financial forecast. The investment request would then reflect the actual stage of preparation.

Public support can help with research, training and enabling infrastructure, while private sponsors take responsibility for the enterprise. Where assistance is proposed, its source and conditions should be stated. An application for support is an unresolved dependency until a commitment exists.

The next decision

Liberia’s agricultural pitch should show how value moves through the business-and how farmers share in that value. A persuasive deck connects the harvest to the buyer, the buyer to revenue, and the revenue to a sustainable operation.

Energy: Investors Need to Know Who Pays for the Power

Generation potential becomes an investment proposition when demand, payment and delivery arrangements are credible.

AI-generated conceptual editorial image; not a photograph of an actual project or meeting.

Today’s Liberia | Investment Analysis | 13 October 2026

Investors need to see how electricity reaches users and how cash returns to the enterprise.

“Invest in Liberia’s energy sector” identifies a development priority. It leaves the commercial questions unanswered. What would be built? Who would consume the electricity? What would they pay? Who carries the risk if payments fall short?

An energy pitch should make those questions visible from the opening slides.

A proposed solar installation serving a processing facility has a different revenue model from a community mini-grid or a larger project supplying a utility. Each requires its own assessment of customers, technical design, approvals, connection arrangements and operating costs. Combining them under one general appeal makes it harder for investors to understand the opportunity.

The Liberia Investment Gateway approach would present each project separately and disclose the state of its evidence. A completed technical study, a preliminary customer discussion and a signed contract are different milestones. A presentation should preserve those distinctions.

For a proposed installation serving commercial customers, the starting point could be documented electricity consumption and an assessment of the service customers need. The business case would then test the proposed price, collection arrangements, customer creditworthiness and the cost of maintaining the system over its life.

Where a power-purchase agreement is proposed, its duration, payment terms and counterparty obligations would require careful review. A signed agreement is valuable evidence, but its ability to support financing also depends on enforceability and the purchaser’s capacity to pay.

Technical reliability matters just as much. Equipment performance, storage requirements, spare parts, maintenance skills and replacement costs should appear in the investment model. A deck that discusses construction but ignores long-term operations leaves a substantial part of the business unexplained.

Public benefits and commercial revenues should also be presented separately. Reliable electricity may support employment and essential services. Those benefits do not automatically produce cash to service debt. Where affordability creates a financing gap, any proposed grant or subsidy must be clearly identified, with unconfirmed support labeled as such.

Energy can also strengthen an agricultural or logistics investment. A processing hub with a credible power plan may offer a more coherent proposition than an isolated facility with uncertain operating costs. But linked projects still need clear contracts and an explanation of what happens if one component is delayed.

Demand needs to be measured

An energy sponsor should begin with the hours and pattern of electricity use, not simply the customer's monthly spending. Refrigeration, milling, offices and other activities have different load profiles. The size of the installation and any storage requirement should follow a technical assessment of the service being promised.

A proposal should also establish whether the customer is willing and able to buy the service on the terms modeled. Today's generator spending may indicate a problem, but it is not automatically an enforceable commitment to purchase power from a new provider.

Why the operating environment belongs in the pitch

The World Bank's September 2024 Liberia Economic Update called for further investment and reforms to support private participation in the energy sector.[4] A May 2026 World Bank analysis of the 2025 Enterprise Survey reported that electricity was the biggest obstacle for 21.6 percent of surveyed firms.[5] Those findings support the importance of energy to enterprise. They do not establish demand or creditworthiness for any particular proposed project.

The practical response is to connect the national problem with customer-level evidence. A sponsor could document consumption, assess customer finances and test how the proposed arrangement performs if demand is lower or collection is slower than expected.

The risk follows the contract

The allocation of risk should be understandable to a reader outside the project team. Who pays if connection works are delayed? Who maintains the system? What happens if the equipment underperforms or the customer's business closes? Where payments and costs use different currencies, the model should examine the effect of exchange-rate movements without assuming that either party can absorb them indefinitely.

Insurance, warranties and contractual remedies can help address particular risks, but the presentation should describe their scope and limitations. Mentioning a warranty does not explain whether its provider can honor it or whether the buyer has the practical means to enforce it.

The sponsor must also show how service quality would be monitored. Metering, maintenance schedules, response times and performance reporting translate an engineering promise into an operating obligation. The business needs staff and a budget to deliver those obligations after the opening ceremony.

Connect productive uses with realistic affordability

An illustrative solar-and-storage project for an agricultural hub could seek customers with known productive loads, while making arrangements for any wider community service separately. That might help clarify revenues and service responsibilities. It would still require technical, commercial and regulatory review before being offered as an investment.

Affordability needs honest treatment. Where the proposed service costs more than users can pay, the gap should remain visible. Any grant, concessional funding or other support in the model should have a stated status. The project should not promise universal low-cost service and strong commercial returns without explaining how both would be funded.

The first investor commitment might be to preparation, customer assessment or technical studies. The construction request should come when the evidence supports it. Liberia's energy presentation would gain credibility by showing that progression explicitly.

The next decision

Liberia’s stronger energy message would describe the customers, the service, the payment mechanism and the delivery plan. Investors need to see how electricity reaches users-and how cash returns to the enterprise that supplies it.

FEATURE 04 / BUSINESS

Infrastructure: A National Need Is Only the Beginning of the Investment Case

Roads, warehouses and digital networks require financing structures that match their revenues and public purpose.

AI-generated conceptual editorial image; not a photograph of an actual project or meeting.

Today’s Liberia | Investment Analysis | 13 October 2026

Maintenance is part of the original investment.

Infrastructure can make other investments possible. Yet a road, warehouse or digital network does not become financeable simply because it is needed. The pitch must explain who will build it, who will use it, how it will be maintained and where payment will come from.

Those questions become especially important when public and private responsibilities overlap.

A cold-storage facility might earn revenue from commercial customers. A public road might require government funding or another lawful payment arrangement. A digital network might depend on subscriptions or contracted business users. These assets should not be presented as if they share the same economics.

Liberia's investment promotion should therefore move from lists of infrastructure needs to distinct project structures. The Liberia Investment Gateway approach offers a useful organizing principle: each opportunity should have an identifiable sponsor, an evidence record, disclosed gaps and a responsible office or project team.

Take a proposed cold-chain facility serving agricultural and fisheries businesses. Its deck should examine customer demand, expected volumes, seasonal variations, location, electricity costs and transport connections. It should show what customers would pay and how much utilization the facility needs to cover its costs.

For a transport project, the assessment would instead examine traffic, economic benefits, land access, construction scope and the proposed funding mechanism. If public payments are part of the structure, investors would need evidence of the appropriate authority, approvals and funding arrangements. A public need cannot be presented as an automatic government guarantee.

Infrastructure pitches should also explain who bears construction overruns, operating failures and demand shortfalls. Moving every risk to the public sector may make a proposal attractive to a developer while creating an unsustainable obligation for the country. Leaving every risk unresolved can prevent financing altogether.

The strongest presentation makes these choices explicit and supports them with realistic assumptions.

Projects can also be developed in phases. A proposed logistics hub might begin with capacity supported by documented customers and expand as demand grows. Phasing may reduce the initial capital requirement, although it still needs technical and commercial justification.

Public accountability should continue after financing. Reporting should distinguish agreements signed, capital committed, funds disbursed, construction completed and services actually delivered. Each represents a different achievement.

The corridor must have customers

For an illustrative logistics proposal near Buchanan, a map would show more than a site. It would identify the businesses the facility intends to serve, the routes connecting them and the assumptions behind projected volumes. The sponsor would need to examine whether customers can reach the facility reliably and whether its charges would be competitive after transport costs.

A warehouse built near an important route can still be underused. A cold room may attract interest while failing to win enough paying business to cover electricity and maintenance. The demand study should ask what users currently do, why they would change and how much they can afford to pay.

Build for the opening year as well as the tenth

Long-term forecasts can support planning, but the opening years determine whether the project survives. The deck should explain commissioning, customer recruitment, staff training and initial utilization. If the first phase depends on a few anchor customers, their actual commitments and

financial strength deserve close attention.

Phased construction can preserve capital until demand is clearer. However, it is useful only when the design allows expansion economically and the smaller phase can operate on its own. A proposal should show the cost and technical implications rather than treat phasing as a universal solution.

Public value needs a payment plan

Some infrastructure offers substantial public benefits without generating enough direct user revenue to attract ordinary commercial financing. That does not make it unimportant. It means the funding discussion needs to account for its public purpose and the government's capacity to support it.

If a private operator is proposed, the parties should examine the payment mechanism, performance requirements and approval process. The investment presentation must separate an intended structure from an authorized agreement. Prospective public support should remain identified as prospective.

The World Bank's 2025 Country Economic Memorandum places structural reform and diversification in Liberia's growth agenda.[2] Infrastructure proposals can contribute to those aims when they explain how businesses and households would use the completed service. A construction budget alone leaves that relationship incomplete.

Maintenance is part of the original investment

Every asset has an operating life. Refrigeration equipment needs servicing; buildings need repairs; roads require maintenance. The costs should be estimated in the original plan and assigned to an identifiable party. Otherwise, the project may deliver an impressive opening and a deteriorating service.

Community effects should also be assessed early. Access routes, construction traffic, land arrangements and drainage can affect people beyond the site. A credible sponsor needs a way to address concerns and document the response, rather than wait for disputes to interrupt work.

The Gateway record could show separate milestones for preparation, approvals, financing, construction and operations. Documents would support each milestone, and gaps would stay visible. An investor could then see both the promise of the asset and the work remaining before a commitment is justified.

The next decision

Liberia should pitch infrastructure as an operating service with a sustainable funding plan. The asset on the cover of a presentation matters. So do the contracts, customers and maintenance arrangements that determine whether it will work.

FEATURE 05 / TECHNOLOGY

Technology and the Deal Pipeline: Turn the Presentation Into a Process

A credible pitch identifies a customer problem; a credible investment system follows the opportunity through to delivery.

AI-generated conceptual editorial image; not a photograph of an actual project or meeting.

Today’s Liberia | Investment Analysis | 13 October 2026

The measure of success should extend from investor interest to capital deployed and operations delivered.

Technology can make Liberia's investment story more ambitious. It can also make it more vague. References to innovation, artificial intelligence and digital transformation do little for investors unless they lead to a defined product, a paying customer and evidence that the business can deliver.

A technology pitch should begin with a practical problem. A proposed service might help businesses reconcile payments, manage stock, connect with suppliers or improve connectivity. Its presentation should explain who experiences the problem, how it is currently handled and why the proposed solution deserves a customer's budget.

The evidence must match the claim. Registered users are different from active users. Active users are different from paying customers. A pilot is different from a recurring contract. Revenue projections should explain those distinctions and account for customer acquisition, support, hosting, security and other operating costs.

Relevant regulatory requirements and data responsibilities must also be examined. A software concept that depends on payments or sensitive information needs a credible plan for the obligations associated with its activities. A future approval should never be presented as an existing authorization.

The Liberia Investment Gateway approach can support a more disciplined presentation by connecting each opportunity to documents, responsible people and a visible stage of preparation. But a platform should organize the investment process, not be mistaken for evidence that a project has passed due diligence.

Across technology and the other sectors, the pitch deck should answer a common set of questions: What is the problem? Who is the customer? What is the solution? Who will deliver it? What evidence supports the business? What capital is required? What could go wrong? What must happen next?

Closing a deal then requires follow-through. Interested investors should be matched to projects that fit their mandate, size and risk tolerance. The sponsor should provide supporting information, respond to questions and record outstanding issues. Site visits, negotiations and financing discussions should have named owners and deadlines.

An introductory meeting is progress. A memorandum of understanding may be progress. Neither should be reported as money invested. Even a signed financing agreement may have conditions that must be satisfied before funds are disbursed.

For Liberia, the measure of success should extend from investor interest to capital deployed and operations delivered. Tracking where projects stall would also reveal whether the missing ingredient is evidence, approvals, sponsor capacity, commercial demand or suitable financing.

Begin with a business owner's working day

For an illustrative inventory and sales platform, the starting point could be a shopkeeper reconciling cash, stock and customer credit at the end of a day. The sponsor would study the existing process, its cost and the errors it creates. A useful product would have to fit the customer's devices, connectivity and working habits.

This framing creates a testable proposition. Does the tool save time or reduce losses? Will the customer use it regularly? Will the customer pay? The answers should influence the product and forecast. A presentation filled with technology terminology can hide the absence of those answers.

Adoption is a commercial question

The financial model should show the cost of bringing a customer on board, offering support and keeping the service running. A free trial may encourage use while postponing evidence of willingness to pay. A paid pilot can provide stronger revenue evidence, although its limited scale should be acknowledged.

The World Bank's May 2026 analysis of Liberia's 2025 Enterprise Survey identifies persistent financing and infrastructure constraints affecting firms.[5] A technology business must examine those conditions as part of its own operating assumptions. It cannot assume that a national need for digital services translates into easy customer acquisition.

Data security and trust also influence adoption. Customers need understandable explanations of who can access their records and what happens if the service fails. The pitch should identify the operational capabilities and applicable approvals the business requires, with specialist review where appropriate.

A Gateway process for every sector

A project record should make the financing conversation easier to follow. It could identify the sponsor, evidence date, preparation stage, capital request, suitable partner types and unresolved dependencies. Access to sensitive commercial documents would need appropriate controls. Public information should provide enough detail to assess relevance without exposing confidential material.

After initial interest, a named coordinator could maintain a log of information requests and responses. Investors need complete, consistent answers, and sponsors need to know which questions are blocking progress. An agreed follow-up date turns a promising meeting into a task with an owner.

A proposed ninety-day follow-through

As an editorial proposal, the first month could focus on selecting a small portfolio and checking the essential evidence. The second could address gaps and match each project to suitable investor mandates. The third could support serious reviews, site visits and negotiation of appropriate next steps. The schedule would depend on readiness; financial close cannot responsibly be promised on a fixed national timetable.

The record of progress should distinguish introductions, due diligence, indicative terms, signed commitments, disbursement and operations. Term sheets may be nonbinding. Signed commitments may have conditions. Money deployed and services delivered deserve their own reporting.

The Gateway's contribution would be clearer information and accountable follow-through. It would not replace investor judgment, professional review or the sponsor's duty to execute. That distinction gives Liberia a credible investment process alongside its public investment message.

The next decision

The country’s investment message can become more precise: here is the opportunity, here is what we can substantiate, here is what remains unresolved, and here is the next decision we are asking you to make. That is a stronger foundation for closing deals than another general invitation to invest.
